

Printing Text and Markdown Files from VS Code

Prompt

how can I print a text or markup or markdown file from VS Code

Reply

In VS Code, **plain text (.txt) and Markdown (.md) files do not have a built-in File -> Print command** like Word does. The easiest method depends on the file type.

For a Markdown (.md) file

- 1 Open the .md file.
- 2 Press **Ctrl+Shift+V** to open **Markdown Preview**.
- 3 The preview shows the formatted document.

VS Code itself still doesn't provide a direct print command for that preview. A convenient solution is to install an extension such as **Markdown PDF**, which can export Markdown to PDF; then open the PDF and press **Ctrl+P**.

For a plain text (.txt) file

- 1 Open the file in VS Code.
- 2 Right-click its tab and choose **Reveal in File Explorer**.
- 3 Open the file in **Notepad**.
- 4 Press **Ctrl+P**.

If you want to print directly from VS Code

There are VS Code extensions specifically for this. Open Extensions with:

Ctrl+Shift+X

and search for:

Print

Extensions such as **PrintCode** or similar printing extensions can add a print command to VS Code.

If you're mainly trying to print **Markdown with headings, lists, code blocks, and nice formatting**, I can show you the best VS Code setup for that.
